Analysis & Improvement Report for CRM Portal

Overview:In this document, I have prepared an analysis covering various aspects of the CRM portal, including the user interface (UI), data handling, page structure, ease of operations, dynamic forms, permissions, and other related features.

UI Feedback:

On first visit, the home page UI appears visually appealing with a cool and funky design. The hero section describes it as a CRM for developers, but upon further observation, it's clear that the application is intended for customer relationship management, team collaboration, and workspace management.

While the current UI is modern and attractive, it doesn't fully align with the functional and operational needs of a CRM platform. In my opinion, a CRM application should prioritize usability, efficiency, and clarity over aesthetic flair.

Suggestion:
The UI should be more professional, minimalistic, and data-driven—focusing on operational workflows rather than a trendy look. This would improve usability and better reflect the nature of the platform.

Got it! Here's your original text with **only spelling and grammar corrections** — no rewriting or restructuring beyond what's necessary for clarity:

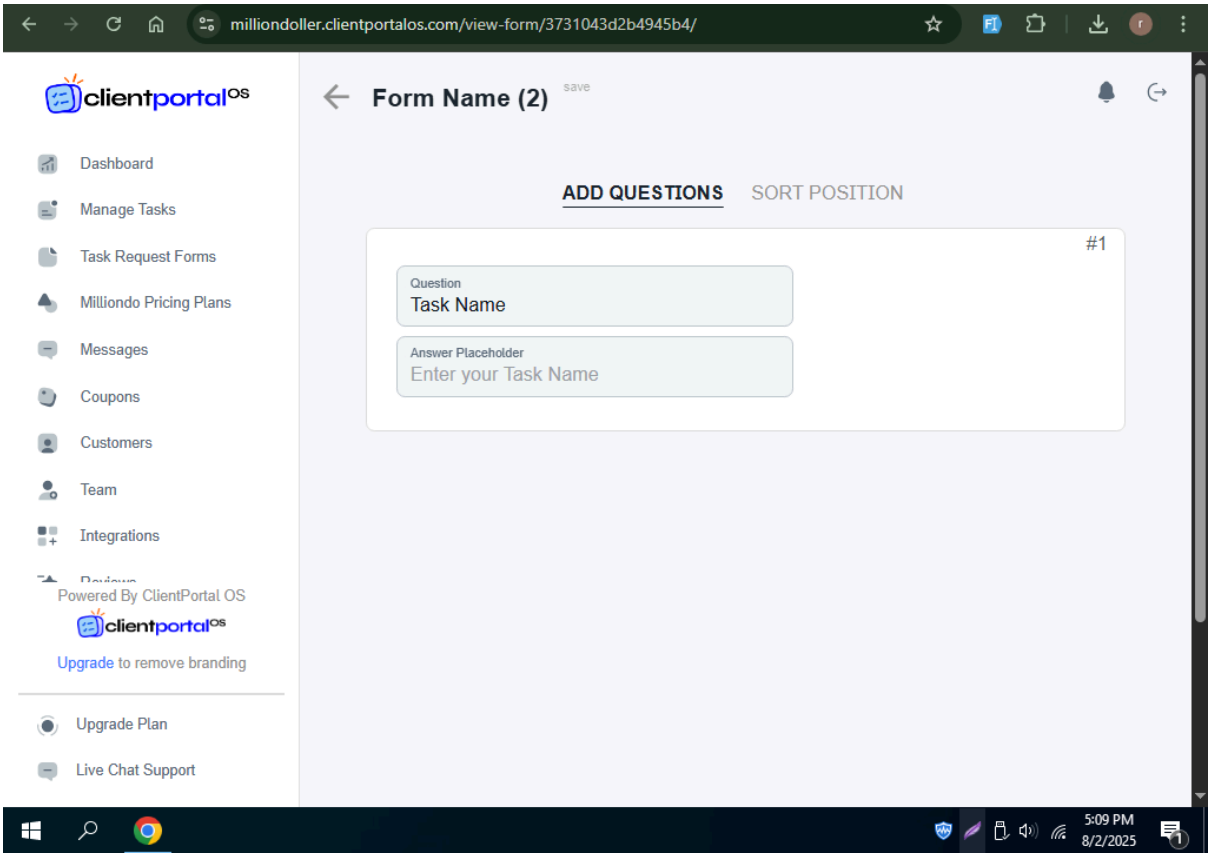

Security:

You need a lot of improvement in security, like adding 2FA.
I have tested creating a customer account with a temp mail. It gave a little warning, but it didn't stop me and allowed me into the system.
So I think in this part you can add a system that checks user email before signup — maybe Genius, SMTP, or some email validation.

Admin Dashboard Pages:

Manage Task
List of tasks — can we filter or instead make them dedicated tabs for each status? Although the present version itself is good.

Task Request Form
Form to create request for task itself — the form has a kind of disabled version, and the Save and Edit buttons should be more highlighted.
There's also a lack of explanation and description of the process.
And I had to build that. I put dynamic fields or added/included more fields feature on that form.

Create New Task

I feel this is a pretty complex procedure to create a new task.

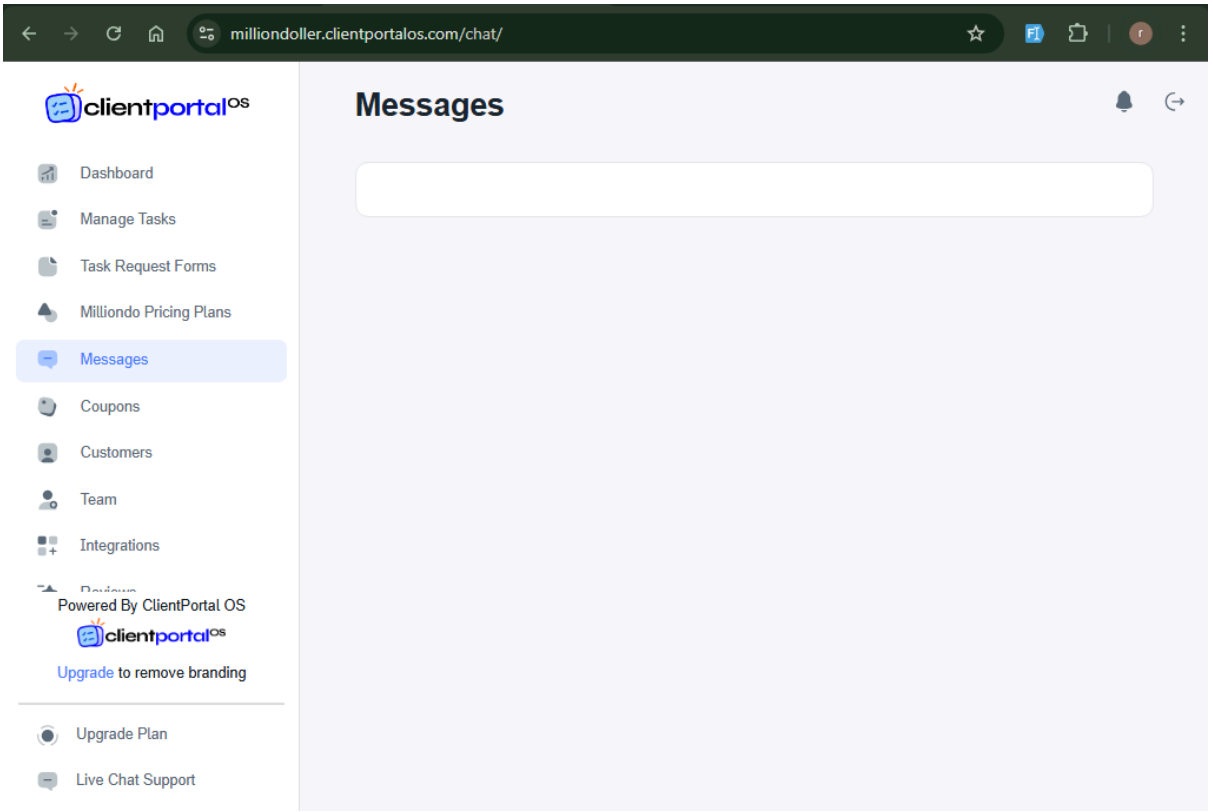

You have to make it easier — the present way around doesn't seem easy to do or reach and fill.

There is no description of the process though, so make it in a simpler way.

Message Page

If there is no message, we should show "No message available" instead.

The present version just renders a simple card and nothing there.

Missing Feature:

These features I feel are missing in your CRM. I think they are necessary in any CRM system, although it depends on different business logic and ideas set.
But if I were to do it, I would add:

- Bulk Notification / Alert / Message Sending Feature — either to all customers / team members or selected ones.

- Adding a Simple Chat Application — so customers can reach out to the workspace admin or teams with any kind of issue or query.

- **Email & SMS Integration** – Send and receive messages from within the CRM.

- **Shared Inbox for Teams** – Handle customer messages collaboratively.

- **Follow-Up Reminders & Auto Follow-ups** – Never miss a lead or task deadline.
- **Knowledge Base / FAQ** – Help customers solve common issues themselves.
- **Payment Gateway Integration** – Stripe is already it core but we can add more payment gateway as well cause different people have different user.

Customer / Teams Onboard Pages:

The signup and login pages are simple and good, but we can design them a bit more if needed

Conclusion

Although the Customer and Teams Dashboards feel good and don’t need many changes, we can still make improvements as per business needs.
I wasn't able to cover everything because there are three or more different areas: the admin dashboard, customer dashboard, and team-specific sections.

But based on the CRM and your target niche, I feel some common features are missing.
If you're planning to go beyond just developers and want this CRM to be used by other businesses and industries as well, then you’ll need to add a lot more features and improvements.

We can also take inspiration from other CRM platforms to help shape and grow this one.

**Note:

Write and prepare by me but just use the chatgpt for fixing the grammar and spelling mistakes.
